【Abstract】 Objective Metaplastic meningioma is rare lesion which is very difficult to diagnose clinically, and is easy to be misdiagnosed. This article aims to reveal the clinical manifestations and histopathological features of this disease. **Methods** One case of ossification metaplastic meningioma was reported and the relevant literatures were reviewed. **Results** A 17 - year - old female patient showed paroxysmal stiffness accompanied by convulsion of extremities, headache, vomiting and fever. Cranial CT scan demonstrated an irregular low-density signal in the right frontal and parietal lobes. The lesion did not have a clear boundary, and there was a calcified high-density signal inside it. The size of the lesion was about 2 cm×1.80 cm×1.70 cm. Cranial MRI scan showed a tumor with size of 2.40 cm×2.10 cm×2 cm, located in the right frontal and parietal lobes, and there was large edema around the lesion. A resection was performed, and a lesion was found in the right frontal and parietal parenchyma, whose one side was close to the cerebral pia mater and did not invade into the dura and the skull. The tumor was yellow, in irregular shape, and had clear boundary, with hard texture and rich blood supply. Its size was about 3 cm×2.50 cm×2 cm. There was extensive ossification and calcification within the tumor under microscope. Tumor cells were flaky and like small nests, which were distributed in the mesh-like arranged trabecular bone. The immunohistochemical staining showed that epithelial membrane antigen (EMA), progesterone receptor (PR), vimentin (Vim) and Bcl-2 were positive for tumor cells with Ki-67 labeling index being about 6%. **Conclusions** Metaplastic meningioma has various metaplastic components and its imaging features are also various. However, it could be diagnosed and identified from other similar tumors by histopathological observation and immunohistochemical staining.

讨 论

脑膜瘤是中枢神经系统常见肿瘤之一,由脑膜皮细胞构成,起源于蛛网膜颗粒细胞的内皮细胞和纤维母细胞,最常发生在颅内,多与硬脑膜关系密

切,亦可发生于椎管,椎管内脑膜瘤相对少见,占椎管内肿瘤的15.50%^[1]。脑膜瘤多见于成人,特别是中老年人,女性好发,而儿童和青少年少见,但其发

生的脑膜瘤侵袭性更强。世界卫生组织将脑膜瘤分为WHO I ~ III级,大多数为WHO I级。脑膜瘤组织形态学多样,可以分为多种亚型,每种亚型的

复发和进展各不相同,化生型脑膜瘤是其中一种少见亚型,属WHO I 级,为具有间叶组织分化的脑膜瘤,可见骨、软骨、脂肪、黏液或黄色瘤样细胞等间叶组织成分,但其临床意义尚不清楚。

化生型脑膜瘤的临床表现与其他类型一样,与肿瘤位置密切相关,临床主要表现为头痛、眩晕和癫痫发作^[2]。大多数患者出现症状就诊时,均可在影像学上发现肿瘤影像,常规CT和MRI有助于诊断,MRI表现为等信号,部分钙化,增强后病灶可强化,由于化生的成分不同,其在T₁WI和T₂WI上信号不同,部分T₁WI呈低信号,部分T₂WI呈低信号^[2]。其化生成分中以骨化生和脂肪化生最为常见^[2-6],也可有黏液样、平滑肌和黄色瘤样化生^[7-8]。有文献报道,“脂肪化生”这一定义用于某些进行性黄色瘤样变并不恰当,其非特异性胞质脂肪样变并非真正的化生,建议改用“脂肪瘤样脑膜瘤”^[5-6]。也有文献报道,化生型脑膜瘤可有多种成分,在诊断时应仔细查找其中有无恶性程度更高的成分,例如骨组织化生型脑膜瘤应注意是否有横纹肌样型脑膜瘤成分,因为横纹肌样型脑膜瘤同样可以出现骨化生,但其横纹肌样成分更突出,为恶性程度较高的类型(WHO III级)^[9]。该例患者化生成分为大量骨化生和钙化区域,部分区域可见少量脂肪化生,未见其他恶性程度更高的成分。

该例患者组织病理学观察显示肿瘤组织广泛骨化和钙化,骨化区域大部分表现为随意排列的大小不等的网状小梁状骨组织,亦可见较大的骨化和钙化区域;肿瘤细胞呈片状和小巢状分布在网状排列的小梁状骨组织间,肿瘤细胞呈短梭形,胞核卵圆形,胞质红染或略透明,细胞大小较一致,核异型性不明显,未见病理性核分裂象;间质内血管丰富,扩张充血;部分区域可见少量脂肪化生,肿瘤边界较清楚,与周围脑组织形成“推挤式”边界,周围脑组织水肿明显。该例患者曾被某国外医院的病理医师诊断为骨母细胞瘤。我们结合其年龄、临床特点、神经影像学、组织学、超微结构和免疫组织化学染色结果,明确诊断为以骨组织为主的化生型脑膜瘤(WHO I 级)。

骨组织化生型脑膜瘤应注意与以下疾病相鉴别。(1)骨母细胞瘤:好发于脊柱和长管状骨,皮质和骨膜下少见,多发生于10~30岁,男性好发。组织学特点除编织状针样骨样基质和骨组织外,最突出的特征是肿瘤组织散在分布的破骨细胞型多核

巨细胞,骨组织间为骨母细胞,分化良好,沿骨样基质边缘排列。该例患者未见沿骨样基质排列的细胞成分,亦未见多核巨细胞,仅见呈短梭形的片状和小巢状肿瘤细胞分布在小梁状骨组织间,可资鉴别。(2)骨瘤:好发于颅骨和面骨,成年男性多发,通常无症状,被认为是骨的错构瘤,一般情况下无需治疗^[10]。其组织学形态由成熟的较宽的小梁状骨组织构成,排列不规则,其间有纤维、血管和脂肪等组织,有时可见造血细胞。该例患者组织学表现为小梁状骨组织间呈片状和小巢状排列的短梭形肿瘤细胞,胞核卵圆形,胞质红染或略透明,未见造血细胞。影像学易将骨组织化生型脑膜瘤误诊为骨母细胞瘤和骨瘤,但组织形态学和免疫组织化学易于鉴别。(3)颅内钙化性假瘤(亦称纤维-骨化性损害):一种极为罕见的瘤样病变。其组织学形态可见成熟的板层状骨质和灶状钙盐沉着,钙化成分间可见梭形细胞,部分区域呈“栅栏”状排列,细胞间有黏液样间质成分;其梭形细胞类似脑膜上皮细胞,但不表达EMA,可资与骨组织化生型脑膜瘤相鉴别,且肿瘤周围可见组织细胞和多核巨细胞形成的肉芽肿^[11-12]。(4)脑室外神经细胞瘤(EVN):较为少见,属WHO II 级,多发生于20~40岁成年人,男女发病率基本相同。CT显示肿瘤钙化和囊性变,MRI呈等或高信号。肿瘤细胞形态单一,胞核圆形或卵圆形,组织学形态多样,可见“菊形团”结构和少突胶质细胞瘤样“蜂窝”状结构等,一般无小梁状骨组织。免疫组织化学神经细胞标志物表达阳性,可与骨组织化生型脑膜瘤相鉴别。(5)少突胶质细胞瘤:属WHO II 级,好发于成人,40~50岁多见,多位于大脑半球白质内。CT显示肿瘤钙化,MRI显示长T₁、长T₂信号的边界清楚病灶,周围水肿不明显。肿瘤细胞中等密度,形态一致,胞核圆形,胞质透亮,可见核周空晕,肿瘤间可见“鸡爪”样丛状增生的毛细血管。免疫组织化学染色有助于鉴别。

化生型脑膜瘤预后较好,以外科手术为主,鉴于其复发可能性^[13],部分患者术后可适当予放射治疗。脑膜瘤的发病机制与NF-2基因突变有一定关系,同时有学者提出了与其发生有一定相关性的其他基因^[14-15],这将给对手术治疗和放射治疗均无明显效果的患者进行靶向治疗提供一定的研究方向。
